Faculty of Sciences and Engineering

Semester: (Fall 2025), B.Sc. in CSE (Day)

Lab Report #3

Course Title: Microprocessors and microcontrollers

Course Code: CSE 304

Section: 232_D4

Lab Experiment Name: Implement a loop to find out the summation of $1^2 + 2^2 + 3^2 + \dots + n^2$. You can take n from user as an input. The code should be able to output a 3 digit number.

Student Details

	Name	ID
1.	Rafi Shah	232002168

Submission Date : 05-11-2025

Course Teacher's Name : Jarin Tasnim Tonvi

1. TITLE OF THE LAB REPORT EXPERIMENT:

Implement a loop to find out the summation of $1^2 + 2^2 + 3^2 + \dots + n^2$. You can take n from user as an input. The code should be able to output a 3 digit number.

2. OBJECTIVES/AIM:

The aim of this lab is to write an assembly language program that takes a number from the user and calculates the summation of squares from 1 to N ($1^2 + 2^2 + 3^2 \dots + N^2$). This program helps us understand how looping, arithmetic operations, and user input/output work in 8086 microprocessor programming. It also improves our ability to handle registers, perform repeated calculations, and display a numeric result in correct decimal format.

3. IMPLEMENTATION PLAN & SYSTEM DEVELOPMENT :

For this program, I first identified the steps needed to take input from the user and then calculate the summation of squares from 1 to N. I initialized the data segment and displayed a prompt to enter a value. After reading the input, I stored it and used a loop to repeatedly square each number and add it to the total sum. Since assembly does not automatically handle decimal output, I manually converted the final result into hundreds, tens, and ones. Then I printed each digit one by one. Finally, I tested the program with different inputs to ensure the output was accurate and displayed correctly. This process allowed me to better understand how input/output operations, comparisons, and conditional logic work in 8086 assembly programming.

4. IMPLEMENTATION:

```
01 .MODEL SMALL
02 .STACK 100H
03 .DATA
04 N DB ?
05 MSG1 DB "Enter N: $"
06 MSG2 DB "Summation of squares is: $"
07 .CODE
08 MAIN PROC
09     MOV AX, @DATA
10     MOV DS, AX
11
12     ; Display "Enter N"
13     MOV DX, OFFSET MSG1
14     MOV AH, 9
15     INT 21H
```

```
17  MOV AH, 1
18  INT 21H
19  SUB AL, 30H
20  MOV N, AL
21  ; New line
22  MOV AH, 2
23  MOV DL, 13
24  INT 21H
25  MOV DL, 10
26  INT 21H
27  ; Display output message
28  MOV DX, OFFSET MSG2
29  MOV AH, 9
30  INT 21H
31  ;Calculate sum of squares
32  XOR BX, BX
33  MOV CL, N
34
35 LOOP_SQ:
36  MOV AL, CL
37  MUL AL
38  ADD BX, AX
39  DEC CL
40  JNZ LOOP_SQ
41
42  ;Convert to 3 digits
43  MOV AX, BX
44
45  MOV CX, 100
46  XOR DX, DX
47  DIV CX
48  MOV BL, AL      ; BL = hundreds
49  MOV AX, DX      ; AX = remainder
50
51  MOV CX, 10
52  XOR DX, DX
53  DIV CX
54  MOV BH, AL
55  MOV CH, DL
56
57  ;Print 3 digits
58  MOV DL, BL
59  ADD DL, 30H
60  MOV AH, 2
61  INT 21H
62
63  MOV DL, BH
64  ADD DL, 30H
65  MOV AH, 2
66  INT 21H
67
68  MOV DL, CH
69  ADD DL, 30H
70  MOV AH, 2
71  INT 21H
72
73  MOV AH, 4CH
74  INT 21H
75
76 MAIN ENDP
77 END MAIN
```

5. OUTPUT:

The screenshot shows a debugger window with two panes. The left pane displays assembly code, registers, and memory dump. The right pane shows the original source code.

Registers:

	H	L
AX	4C	35
BX	05	00
CX	05	0A
DX	00	35
CS	F400	
IP	0204	
SS	0740	

Memory Dump:

	F400:0204	F400:0204
F4200:	FF 255 RI-	BIOS DI
F4201:	FF 255 RI-	INT 021h
F4202:	CD 205 =	IRET
F4203:	21 033 !	
F4204:	CF 207 @	ADD [BX + SI], A
F4205:	00 000 NI	ADD [BX + SI], A
F4206:	00 000 NI	ADD [BX + SI], A
F4207:	00 000 NI	ADD [BX + SI], A
F4208:	00 000 NI	ADD [BX + SI], A

Output Window:

```
SCR emulator screen (80x25 chars)
Enter N: 5
Summation of squares is: 055
```

6. ANALYSIS AND DISCUSSION:

In this experiment, I observed how assembly language handles arithmetic operations and loops at a low level. Unlike high-level languages, every step of the summation and multiplication had to be manually controlled using registers. The program successfully calculated the square of each number and accumulated the total using a loop, which helped reinforce my understanding of counter-based iteration. Converting the final result into three individual digits was a key challenge, as direct decimal output is not available in assembly. Through testing with different inputs, I confirmed that the program produces accurate results for single-digit inputs and displays them in three-digit format. Overall, the lab improved my practical understanding of microprocessor instruction flow and data handling.

7. SUMMARY:

In this lab, I developed an assembly program to calculate the summation of squares from 1 to N using a loop. The program takes a single-digit input from the user, multiplies each number by itself, and adds the results. I also learned how to break down a number and display it in a three-digit format since assembly does not print values directly. While writing this program, I practiced using registers, loops, and arithmetic instructions. Overall, the experiment improved my understanding of how low-level operations are executed inside the 8086 microprocessor.
